COURSEWORK ASSIGNMENT SUBMISSION

Name: Daksh Srivastava **Roll No:** 150096725087
Subject: Software Engineering & Project Management **Day:** Day 12 — Requirements Analysis, Prioritisation & Conflict Resolution

---

Section 12: Classroom Activity — Requirements Analyst Challenge

Systematic refinement and prioritization of ambiguous, conflicting, and incomplete stakeholder statements for CEMS.

Raw Statement	Identified Defect	Clarification Questions	Refined Testable Requirement	MoSCoW
The system should show important events.	Ambiguous adjective ("important").	What criteria define "important"? Is it based on campus-wide flag, date proximity, or attendee count?	The home page shall display an "Upcoming Featured Events" carousel containing active events tagged as featured by the Dean of Student Affairs.	Should Have
Students can register even when the event is full.	Direct logical conflict with capacity constraints.	Does this refer to an unconfirmed waitlist? What is the maximum waitlist capacity limit?	When registered count equals event capacity, the system shall permit up to 20 eligible students to join a FIFO waitlist without guaranteed entry.	Could Have
Only coordinators can publish events.	Missing access control role and approval workflow details.	Can any student coordinator publish, or is faculty supervisor approval required?	An event shall only achieve "Published" status after a draft created by a registered Coordinator receives digital approval from a Faculty Mentor.	Must Have
The system shall send a notification for every change.	Vague frequency; extreme spam risk for minor edits.	Which specific changes trigger alerts (venue, time, speaker)? Which communication channels are used?	The system shall send an automated email alert to registered attendees only when event date, start time, or physical venue changes.	Should Have

Registration must be easy and fast.	Non-verifiable subjective statement.	What is the maximum acceptable registration completion time and number of form fields?	A student authenticated via campus SSO shall complete event registration in no more than 3 user clicks and within 30 seconds on mobile web.	Must Have

Section 15: Homework — Requirements Analysis & Conflict Resolution Packet

Formal refinement, prioritization, and conflict management documentation for the College Event Management System.

1. Analysis of Raw Stakeholder Statements

- **Statement 1: "The app should never crash during festival launch." ->** Refined: System shall maintain 99.9% uptime during the 72-hour festival window, with automatic container restart within 30 seconds of service failure (Must Have).
- **Statement 2: "Security must be top notch." ->** Refined: All communication must enforce TLS 1.3 encryption, and administrative sessions must timeout after 15 minutes of inactivity (Must Have).
- **Statement 3: "Organizers should see everything." ->** Refined: Event organizers shall access a read-only analytics dashboard displaying registrations, cancellations, and demographic breakdowns for their assigned events (Should Have).

2. Stakeholder Conflict Analysis & Resolution Record

- **Conflict Description:** Student Club Coordinators demand the ability to accept offline spot-registrations at the auditorium door to fill empty seats, whereas the Campus Safety Committee strictly mandates that venue capacity limits must never be exceeded under any circumstances.
- **Option A:** Allow unlimited offline paper registration at the door.
- **Option B:** Enforce strict 100% online registration cutoff 2 hours prior to the event.
- **Selected Resolution & Rationale:** Implement a dynamic "Late Gate Registration" feature inside the CEMS mobile portal. If registered students fail to check in 10 minutes prior to event start time, the system automatically marks their seats as forfeited and releases them to waiting students via the mobile portal in real time. This maximizes venue utilization while mathematically preventing capacity limit violations.
